Other screen size options are also available

1 iDentalTouch is a Windows based multi-touch consultation and patient education software for dental health professionals.

2 iDentalTouch will increase patient satisfaction leading to rise in your clinic's profit and elevate clinic's image.

3 By showing patients images like panorama, CT and intra-oral camera and also references like clinical images and surgical videos concurrently, iDentalTouch help patients understand the treatment they will receive.

4 iDentalTouch enhances communication between dentist and patient and also increases the credibility of dental services in clinics and hospitals.

5 iDentalTouch will decrease psychological burden on the patient with a visually pleasant consultation using a touch screen, and will also increase the rate of consent for surgeries.

6 In case of absence of a consultant, a substitute staff member can fill in. iDentalTouch will integrate the consultation proces and effectively reduce the consulting time.

7 Dental consultation directly affects the clinic's profit. iDentalTouch will play the role of critical medium to convince patients for costly surgeries like implants.

8 Since every consulting content written and recorded on iDentalTouch will be saved in a specific patient's folder, the dental clinic is able to reidentify the patients' dental history.

9 iDentalTouch will improve patients' confidence in your clinic by sending the consultation pictures to patients' smartphones through internet. Consultation files automatically synchronized to patient's phone using our Cloud technologies

Features

- ✓ Patients registration
- ✓ Search patients
- ✓ Patients folder
- ✓ 30+ images simultaneously
